

NOVA Usage Guide

NOVA brings project documents, decisions, responsibilities, deadlines, and risks together in one place.

Open the website: [NOVA Project Memory](#)

1. View the project overview

Select **Dashboard** to see the recorded project situation, including the approved target date, identified project lead, completed work items, and outstanding approvals.

2. Explore the project's history

Select **Timeline** to browse decisions, activities, and other recorded events in date order. Use the search and filters to narrow the results. Select an event to review its supporting passages and source information.

Select **Calendrier** to view dated activities in a monthly calendar.

3. Browse information by topic

Select **Dossier** to explore decisions, responsibilities, commitments, deadlines, and risks grouped by project topic. Open the supporting evidence to understand where an item came from.

4. Find supporting evidence

Select **Evidence** and enter a keyword, subject, or work-item reference. Review the matching passages and their source details to verify information.

5. Ask NOVA a question — local demonstration

Select **Ask NOVA** and enter a question in everyday language, such as:

- What is the currently approved launch date?
- What are the main project risks?
- Who is responsible for a particular action?

Review the answer and its supporting references.

The AI chat works on our local computer but is not working on the hosted website. We will demonstrate this feature live to the jury on our computer. Please use the other sections of the hosted website to explore the project and its evidence.

6. Add new information

Select **Updates** and upload the new document. Review the extracted text and source date, correcting them if necessary. If you make changes, select **Analyser les impacts** before continuing.

Review the proposed effects, then select **Intégrer au projet** to include the information. Check the affected project views and use the Timeline to review earlier records alongside the new information.

7. Read a short summary

Select **Bonus** for a brief overview of key project points and risks.

Tools, manual steps, and limitations

NOVA was built using React, Python, and FastAPI, and the website is hosted on Railway. The jury does not need a paid subscription to consult it.

Users must review imported text and dates, check supporting sources, and confirm whether an update should be added. Poor-quality scans or images may need manual correction.

NOVA reflects the documents provided; it cannot confirm undocumented events. Planned activities are not proof of completion, and conflicting or incomplete records may require human review. The AI chat is available only during the local demonstration described above.
